Introduction

COE 322

31 August 2025

I am studying computation because I fell in love with coding. My very first coding class was in my freshman year of high school. It was focused on taking code and fixing/altering it to meet the criteria. I was infatuated with the way the code turned into pictures. I have always been math-minded, and to me it felt like an equation. I continued to take coding classes after this, and it only deepened my interest.

Going into junior year of high school, I started to focus on what I wanted to study. I hadn't the slightest idea of what direction to go into. I was thinking of accounting or computer science. After I had been in my classes for half a year, I learned I loved calculus and physics. I decided to attend a SWE meeting to learn more about engineering. After the meeting, I decided my love of physics and calculus fit perfectly with engineering. I started to look into different programs for engineering, and had no real preference. I ended up applying to UT for electrical and computer engineering and petroleum engineering. Shortly after applying, my neighbor informed me that his son was in a small engineering program at UT called computational engineering. I had never heard of this before, so I decided to sit down with him and discuss it. I knew after I had talked to him that computational engineering was my perfect fit. It was a mix of everything I had ever liked about school. The next day, I went and changed my preferences for my major.

I am hoping to get a deeper understanding of C++ out of this class. COE 301 was my first encounter with the programming language. I am also looking forward to using GitHub. It was

used often at my last internship, but I was never taught how. The thing I am overall the most excited about in this class is applying my C++ skills. I am excited to learn real applications.
